

NEXZEN DOCUMENTATION

Nexzen User Manual

Customer usage, admin controls, hidden paths, storefront features, and a detailed Active Orders Pipeline guide.

Nexzen User Manual

This manual explains how to use the Nexzen website from both the customer side and the admin side.

It is written for day-to-day operation of the live site, with special focus on:

- customer-facing features
- hidden admin paths
- admin panel tools
- content editing flows
- coupon and inventory management
- search and compare features
- detailed notes for the Active Orders Pipeline

1. Website Overview

Nexzen is an electronics ecommerce website built for development boards, embedded hardware, sensors, maker kits, wireless/IoT modules, and related accessories.

The platform includes:

- homepage hero banners
 - category architecture cards
 - product catalog and clean search flow
 - recent search suggestions
 - compare products
 - cart and checkout
 - coupon support
 - COD and Razorpay payment support
 - order tracking and invoice download
 - wishlist, reviews, and support flows
 - back-in-stock alerts
 - admin dashboard for store operations
-

2. Main Public Website Paths

These are the important customer-facing URLs.

Core pages

- [/](#)

Homepage

- [/p](#)

Main product catalog

- [/search](#)

Search results page

- [/compare](#)

Product compare page

- [/cart](#)

Shopping cart and checkout flow

- [/active-orders](#)

Customer active orders page

- [/ordered-items](#)

Delivered/completed order history page

- [/profile](#)

Customer profile and account information

Product pages

Depending on the navigation source, products may open under:

- [/products/\[slug-or-id\]](#)
- [/p/\[slug-or-id\]](#)

Both are used by the storefront.

3. Search Experience

The website includes a cleaner search flow than traditional query-heavy URLs.

What users can do

- type in the navbar search

- see matching product suggestions while typing
- click a suggestion to open a product
- go to `/search` without exposing the raw query in the visible URL
- use compact filters without another duplicate search bar

Search features currently available

- live product-name suggestions
- recent searches per signed-in user
- search history stored against the user record
- search pagination
- mobile-optimized search layout

Search history behavior

If the user is signed in:

- search terms are stored in the database
 - search history is mapped to the authenticated user
 - clicking the search bar can show recent searches for that user
-

4. Catalog and Product Features

The storefront supports more than basic listing and detail pages.

Catalog features

- product grid
- search
- compact filters
- availability filter
- price filter
- pagination
- compare actions
- recently viewed products

Product detail features

- product image/gallery support
- stock display
- technical and descriptive sections
- review section
- frequently paired or related hardware logic
- pincode-based delivery estimate
- back-in-stock alert button for unavailable items

Compare page

Path:

- [/compare](#)

Capabilities:

- compare multiple products side by side
 - remove one compared item
 - remove all compared items at once
-

5. Account, Cart, and Checkout Features

Account features

- sign in / sign up
- saved profile details
- saved addresses
- recent search history
- active orders
- delivered items

Cart and checkout features

- add to cart
- quantity handling
- checkout with shipping address
- coupon application
- COD orders
- Razorpay online payment orders

Payment logic

For COD:

- order is created immediately
- payment status starts as [PENDING](#)

For Razorpay/online payment:

- order is created first
- payment status starts as [AWAITING_PAYMENT](#)
- Razorpay order is created
- successful verification or webhook capture marks payment as [PAID](#)

Invoice support

Each order supports invoice download as PDF from the customer order views.

6. Orders, Tracking, and Customer Order Views

Active orders page

Path:

- </active-orders>

This page is for orders that are still in progress.

Users can see:

- order ID
- order date
- total amount
- tracking number
- courier name
- latest status update
- order timeline
- ordered items
- support ticket ID
- invoice download

Users can also:

- cancel eligible orders

Delivered items page

Path:

- </ordered-items>

This page shows delivered/completed orders.

Users can:

- review delivered items
- download invoice PDF
- request return for eligible delivered orders

Timeline stages shown to customers

The order timeline is presented as:

1. [pending](#)
2. [processing](#)

3. shipped
 4. delivered
-

7. Wishlist, Reviews, and Support

Wishlist

Users can save products to wishlist while signed in.

Reviews

Users can leave product reviews and ratings.

Support

Orders generate support references, and support ticket handling is built into the order experience.

8. Back-In-Stock Alerts

When a product is out of stock, signed-in users can subscribe for stock alerts.

How it works

- user clicks the stock alert button on an out-of-stock product
 - alert is stored per user and per product
 - when stock is restored, notification emails can be sent
 - admin dashboard also shows stock-alert analytics
-

9. Hidden Admin Access Paths

The admin area does **not** use the public `/admin` path directly.

Actual login path

- `/nexzen-control-room/login`

Actual admin dashboard path

- `/nexzen-control-room`

Important security behavior

- direct `/admin` access is intentionally blocked
- the hidden path rewrites internally to the admin app
- admin requests can be restricted by allowed IP configuration

- admin routes are protected by session and CSRF checks

Internal rewrite behavior

Public admin path:

- `/nexzen-control-room`

Internally rewritten to:

- `/admin`

This means staff should always use the hidden path, not `/admin`.

10. Admin Login and Recovery

Admin login page

Path:

- `/nexzen-control-room/login`

Standard login

Admin signs in with:

- username
- password

Recovery options

If repeated password failures happen, recovery options become available:

- login with OTP
- reset password

Current login-throttling behavior

- password attempts are rate-limited
 - step-up recovery unlocks after repeated failed attempts
 - OTP is email-based
 - reset links are token-based and one-time-use
-

11. Admin Dashboard

Dashboard path

- `/nexzen-control-room`

What the dashboard shows

- quick action buttons
- total products
- total categories
- low stock count
- revenue summary
- orders today
- pending orders
- stock alert counts
- top searches
- back-in-stock watchlist
- recent products
- low stock priority list

Main dashboard action buttons

The current admin dashboard includes:

1. [Upload New Product](#)
2. [Manage Catalog](#)
3. [Manage Active Orders](#)
4. [Launch CRM Engine](#)
5. [Edit Category Architecture](#)
6. [Manage Brands](#)
7. [Manage Coupons & Discounts](#)
8. [Manage Hero Banners](#)
9. [Manage Highlights](#)
10. [Manage Collections](#)

Admin route map

- </nexzen-control-room>

Dashboard

- </nexzen-control-room/products/upload>

Upload new product

- </nexzen-control-room/products>

Catalog manager

- </nexzen-control-room/orders>

Active orders pipeline

- </nexzen-control-room/crm>

CRM engine

- </nexzen-control-room/categories>

Edit Category Architecture

- </nexzen-control-room/brands>

Manage brands

- </nexzen-control-room/coupons>

Manage coupons and discounts

- </nexzen-control-room/banners>

Manage hero banners

- </nexzen-control-room/highlights>

Manage homepage highlights

- </nexzen-control-room/collections>

Manage collections

12. Upload New Product

Path

- </nexzen-control-room/products/upload>

Purpose

Used to create a new product with pricing, branding, media, and inventory details.

Fields and capabilities

- product name
- SKU
- category
- brand
- barcode
- status: active / draft / archived
- price
- compare-at price
- cost price
- stock quantity
- low stock threshold
- weight in grams

- badge and badge tone
- requires shipping
- track inventory
- short spec
- dependency products
- short description
- full description
- variants
- configurations
- gallery image URLs
- technical highlights
- usage/setup guide
- primary product image upload
- multiple gallery image uploads

AI-assisted product creation

The product upload form also supports AI-assisted field generation.

Behavior:

- entering a product name and using the AI trigger can fill major fields
- the AI can help with:
 - descriptions
 - branding guess
 - badge/tone
 - technical highlights
 - guide content
 - some pricing/metadata suggestions

This is a productivity tool, not a substitute for final admin review.

13. Manage Catalog

Path

- `/nexzen-control-room/products`

Purpose

Used to search, filter, edit, export, and delete products already stored in the catalog.

Features

- search products
- filter by price

- filter by brand
- IoT filter
- low stock filter
- edit a product inline through the product form
- delete product
- paginate through the catalog
- export current product data to Excel

Best use

Use this page for maintenance after products already exist.

14. Edit Category Architecture

Path

- `/nexzen-control-room/categories`

Purpose

Controls the homepage category-card section labeled Category Architecture.

What can be edited

- category name
- slug
- description
- icon identifier
- image URL
- uploaded category image

Image handling

Category images can be:

- pasted via URL
- uploaded from the admin page

Uploaded category images are stored using the category identifier logic and connected back to the category record.

Storefront effect

These category entries directly affect the cards visible on the homepage category section.

15. Manage Brands

Path

- </nexzen-control-room/brands>

Purpose

Manage product manufacturers and brand metadata.

Features

- add brand
- edit brand
- search brands
- delete brand
- add logo URL
- store optional description

Brands can then be attached to products in the upload/edit product flow.

16. Manage Hero Banners

Path

- </nexzen-control-room/banners>

Purpose

Controls the homepage hero banner slider.

Editable fields

- slide title
- subtitle
- eyebrow text
- primary link
- primary CTA text
- secondary link
- secondary CTA text
- side metric text
- display order
- accent gradient classes
- banner image upload

Storefront result

These entries control the main hero section of the homepage.

17. Manage Highlights

Path

- `/nexzen-control-room/highlights`

Purpose

Controls the homepage trust/value highlight section.

Fields

- label
- value
- detail
- display order

Example use cases

- fast dispatch
 - secure payment
 - support response time
 - warranty
-

18. Manage Collections

Path

- `/nexzen-control-room/collections`

Purpose

Manages featured merchandising collections used by the storefront.

Fields

- collection name
- slug
- description
- image URL
- display order

Typical examples

- Creator Boards
 - IoT Starters
 - Sensor Bundles
-

19. Manage Coupons and Discounts

Path

- </nexzen-control-room/coupons>

Purpose

Create and control coupon-based promotions.

Coupon features

- create coupon code
- set discount percentage
- set minimum order value
- set maximum uses
- set expiry datetime
- restrict coupon to a category slug
- enable/disable coupon
- adjust discount percentage inline

Important business rules

The website validates:

- coupon exists and is active
 - coupon is not expired
 - coupon has not reached max usage
 - order meets minimum order value
 - category restriction matches eligible products
 - customer does not reuse the same coupon if already used before
-

20. CRM Engine

Path

- </nexzen-control-room/crm>

Purpose

Provides a searchable customer directory for operations and support use.

Searchable fields

- customer name
- email
- phone
- internal user ID
- ordered product names
- ordered product IDs
- order IDs
- cart product names
- cart product IDs

What admins can see

- customer identity block
- order count
- active cart item count
- recent order traces
- cart retention snapshot

This helps operations staff quickly understand both purchase history and current cart intent.

21. Admin Analytics and Audit Trail

Dashboard analytics

The admin dashboard includes:

- paid revenue total
- paid order count
- today order count
- pending order count
- stock-alert totals
- top searched terms
- most-watched out-of-stock products
- low stock products

Audit trail

Recent admin actions are recorded and displayed in the admin area.

Examples include:

- order item status changes
- bulk order acceptance
- order status changes
- user-level bulk acceptance

This helps with accountability and traceability.

22. Detailed Note: Active Orders Pipeline

This is the most important operational flow in the admin panel.

Main path

- `/nexzen-control-room/orders`

Purpose

This page is the operational queue for incoming and unresolved orders.

It is designed to help admins:

- review recent orders
 - see payment context
 - inspect order items
 - accept or reject item-level requests
 - perform bulk acceptance actions
 - work user-by-user instead of only order-by-order
-

22.1 What counts as an active order

On the admin dashboard, active/pending operational work is counted from orders whose status is in:

- `pending`
- `accepted`
- `processing`

These orders contribute to the dashboard pending-order badge.

22.2 How orders enter the pipeline

COD order flow

When a customer places a COD order:

- order is created immediately
- `order.status` starts as `pending`
- `paymentStatus` starts as `PENDING`

- tracking number is generated
- support ticket ID is generated
- estimated delivery is generated
- order email can be sent

Online payment order flow

When a customer places an online order:

- order is created first
- `order.status` starts as `pending`
- `paymentStatus` starts as `AWAITING_PAYMENT`
- a Razorpay order is created
- internal `razorpayOrderId` is stored on the order

After payment success:

- signature verification or webhook confirmation runs
- `paymentStatus` becomes `PAID`
- order is finalized
- if status was not already advanced, order becomes `accepted`
- payment ID is stored
- customer/admin notification emails can be sent

So, online orders usually enter the active pipeline after successful payment verification.

22.3 How the admin orders page is organized

The admin orders page does not simply dump raw orders in a flat list.

It groups orders by user/email so staff can resolve workload from a customer-centric view.

For each grouped customer block, admins can see:

- customer name
- email
- action-item count
- all of that customer's fetched orders

The groups are sorted by highest pending work first.

This makes the page useful for daily triage.

22.4 Search behavior in the orders pipeline

The orders admin search supports locating orders by:

- tracking number
- phone number

- user email
- user name
- user phone

Only the newest set of orders is fetched for performance, so it behaves like a focused operations board rather than a full historical warehouse.

22.5 What an admin sees per order

Inside each expanded user block, each order row shows:

- short order ID
 - created date
 - shipping location snippet
 - payment status
 - payment method
 - Razorpay payment ID if available
 - item list
 - item-level approval controls
 - total revenue
 - discount amount if applied
 - current order status
-

22.6 Item-level status logic

Each order item can be set to:

- pending
- accepted
- rejected

This is important because item-level resolution can differ from full-order resolution.

For example:

- one item may be accepted
 - another may be rejected
 - the parent order then becomes partially resolved
-

22.7 Parent order status logic

When item statuses change, the system recalculates the parent order status.

Rules currently used:

- if all items are accepted, order becomes accepted
- if all items are rejected, order becomes rejected

- if there is a mix of resolved states, order becomes `partially_resolved`
- otherwise it can remain in its prior working state

The admin can also explicitly set order status through the order update route using values such as:

- `pending`
 - `processing`
 - `accepted`
 - `waiting`
 - `rejected`
-

22.8 Bulk actions

There are three major admin bulk-resolution behaviors.

A. Quick Accept for a single order

From a single order row:

- all order items are accepted
- parent order becomes `accepted`

B. Accept All Products for one user

From the user group header:

- all pending items for that customer email are accepted
- matching orders in working states are updated to `accepted`

C. Item-level accept/reject

The admin can resolve one item at a time for more precise control.

This is useful when:

- one SKU is available and another is not
 - one item is valid and another requires hold/review
-

22.9 Payment context inside the pipeline

The order dashboard also tells the operations team whether an order is:

- COD / cash flow
- online flow
- awaiting payment
- paid

This matters because fulfillment behavior can depend on payment confirmation.

In general:

- COD orders may remain operationally pending until accepted/processed

- Razorpay orders should be treated as financially confirmed after successful verification marks them **PAID**
-

22.10 Recommended operational meaning of statuses

These are the practical meanings admins should use.

pending

- new order
- not yet accepted into fulfillment
- needs review

accepted

- approved for handling
- valid inventory/business approval
- can proceed to packing/dispatch logic

processing

- actively being prepared or packed
- fulfillment is underway

waiting

- on hold
- waiting for stock, confirmation, or special review

partially_resolved

- some items accepted, some rejected
- admin should review final customer communication if needed

rejected

- order or all items rejected

shipped

- moving with courier

delivered

- delivered to customer

cancelled

- cancelled by customer or operations process

return_requested

- customer requested return after delivery
-

22.11 Customer-side relationship to the pipeline

The admin pipeline is not isolated. It affects what the customer sees.

Customers later see:

- timeline progress
- latest tracking update
- active-order visibility
- delivered-order visibility
- cancel eligibility
- return eligibility

Important customer actions tied to status:

- customers can cancel when order is in **pending**, **processing**, or **accepted**
 - customers can request return when order is **delivered** or **completed**
-

22.12 Emails and audit logging

The active orders flow is connected to system communication and audit history.

Examples:

- payment success can trigger customer/admin emails
- accepted transitions can trigger order-confirmation style email behavior
- admin item changes are logged
- bulk accept actions are logged
- order status updates are logged

This creates a stronger operational record.

22.13 Practical daily workflow for admins

Recommended team workflow:

1. Open **/nexzen-control-room**
 2. Check the **Manage Active Orders** badge count
 3. Open **/nexzen-control-room/orders**
 4. Search for a customer if required, otherwise review highest pending groups first
 5. Inspect payment status before fulfillment decisions
 6. Accept or reject item-level requests
 7. Use Quick Accept only when the full order is clearly valid
 8. Use customer-level Accept All only when all pending items across their open orders are approved
 9. Move accepted orders forward to **processing**
 10. Keep tracking and customer updates aligned with actual fulfillment progress
-

23. Search, Compare, and Analytics Features Added

Some of the strongest newer features added to the platform are:

- clean search route
 - live search suggestions
 - user-specific recent search history
 - compare page with remove-one and remove-all
 - compact filters
 - saved addresses
 - coupon rules engine
 - invoice PDF download
 - back-in-stock alerts
 - admin analytics
 - admin audit trail
 - Razorpay payment verification and webhook support
 - category-image editing from admin
-

24. Recommended Admin Best Practices

- always access admin through </nexzen-control-room>
 - never share the hidden path publicly
 - verify banner, category, and collection content before saving
 - review AI-generated product text before publishing
 - use consistent SKU and barcode formats
 - use low-stock filters daily
 - review top searches and watchlist products weekly
 - keep coupon expiry and usage caps realistic
 - rely on audit log when investigating unexpected changes
-

25. Quick Reference

Customer quick links

- Home: [`/`](/)
- Catalog: [`/p`](/p)
- Search: [`/search`](/search)
- Compare: [`/compare`](/compare)
- Cart: [`/cart`](/cart)
- Active Orders: [`/active-orders`](/active-orders)

- Delivered Orders: </ordered-items>
- Profile: </profile>

Admin quick links

- Admin Login: </nexzen-control-room/login>
 - Dashboard: </nexzen-control-room>
 - Upload Product: </nexzen-control-room/products/upload>
 - Manage Catalog: </nexzen-control-room/products>
 - Active Orders: </nexzen-control-room/orders>
 - CRM: </nexzen-control-room/crm>
 - Categories: </nexzen-control-room/categories>
 - Brands: </nexzen-control-room/brands>
 - Coupons: </nexzen-control-room/coupons>
 - Hero Banners: </nexzen-control-room/banners>
 - Highlights: </nexzen-control-room/highlights>
 - Collections: </nexzen-control-room/collections>
-

26. Final Note

This manual reflects the current Nexzen implementation in the project codebase, including hidden admin routing, current storefront features, and the admin order-operations model.

If the team adds new routes, new order statuses, or more fulfillment controls later, this manual should be updated together with the product.
